Are you now seeing excessive downloads from MIT's IP block on dates different from those previously identified, larger downloads than you had previously identified during the previously identified periods, or both?

If you have new time periods, please let me know as promptly as possible the dates and the suspected IP addresses.

Thank you,

Steve

Subject: MIT matter -- worse than we thought

Hi Steve,

In the process of looking through our records to respond to the subpoena, our Tech guys are finding far more unlawful activity coming from MIT than we initially thought. While we initially thought about 500,000 articles had been downloaded (which amounts to approximately 8% of the database), it now looks like in November and December alone, over 2 million articles were downloaded, and the pattern appears to be the same as for the dates we've already identified, meaning it looks like the same individual. We think there's a reasonable chance that at least half and possibly close to the entire corpus of our database has been downloaded by the individual in question.

More research to do on this, but I wanted to give you a heads up on how this is trending.
